

## Release & Change Management - Niche Banking Software

Our customers run regulated environments; changes must be traceable and reversible.

All production deploys require a change ticket, peer review, and CAB approval for high-risk windows (month-end, tax season).

Blue/green or canary patterns are preferred for API gateways. Database migrations must be backward compatible for one release.

Feature flags: default off in production until KM documentation and support macros are published in Stratum.

Rollback: keep previous container images and DB migration down scripts validated in staging before go-live.
