

Treasury & Cash Management - API Integration Patterns

Helps integration engineers work with corporate banking APIs safely.

Idempotency-Key headers are mandatory for payment initiation to prevent duplicate settlement on retries.

Webhooks: verify signatures with the bank-published JWKS; rotate keys per security bulletin.

Pagination: cursor-based for large statement extracts; respect rate limits to avoid throttling during EOD peaks.

Test data: use sandbox BICs/IBANs only; never point integration tests at production endpoints with real credentials.
